Geothermal piles

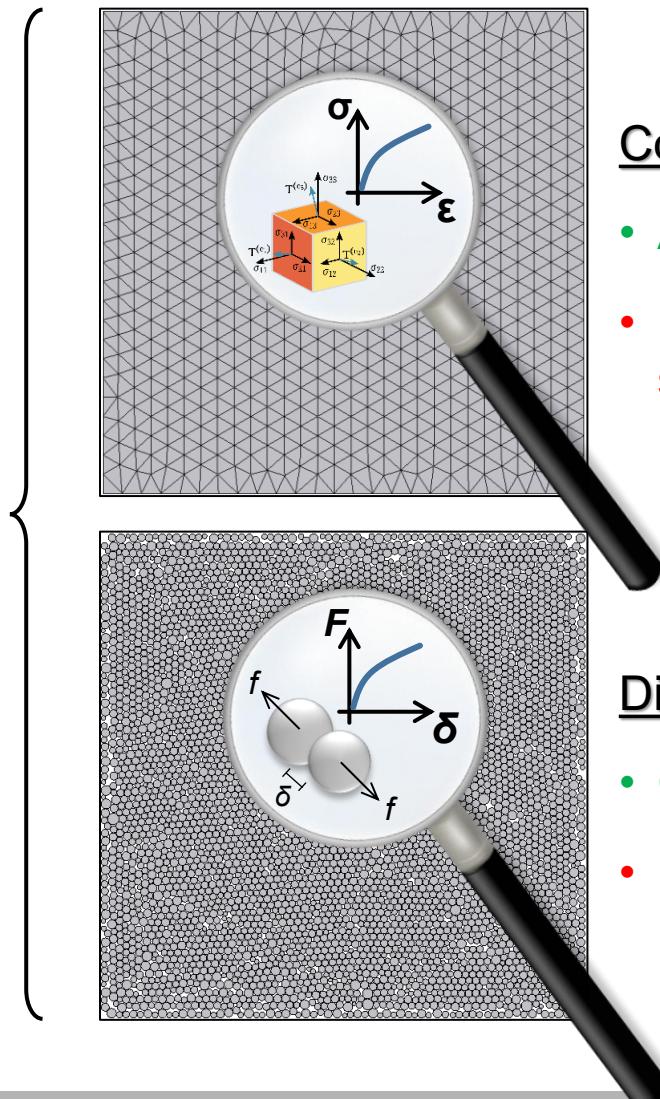

Johnston, KSCE J. Civil Eng., 15:643-653, 2011

Flash frictional heating  
in seismic activities

# Modeling Limitations

## Dichotomy of numerical approaches for granular media

### Continuous methods

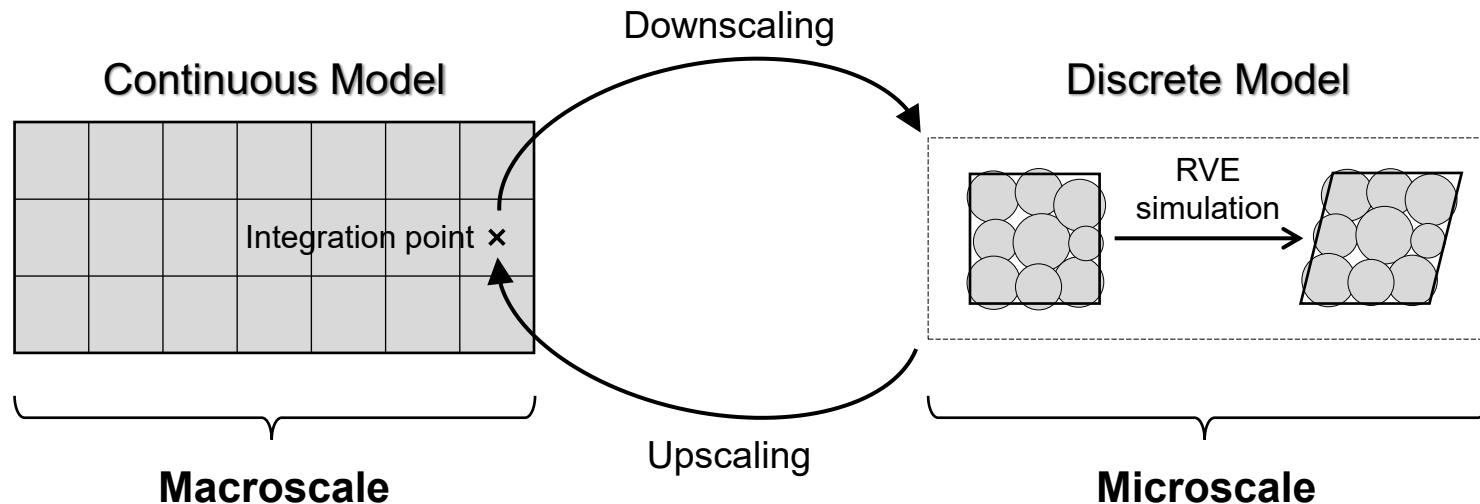

- Affordable computational cost.
- Phenomenological, scale-specific constitutive laws.

### Discrete methods (DEM)

- Grain-scale accuracy.
- High computational cost.

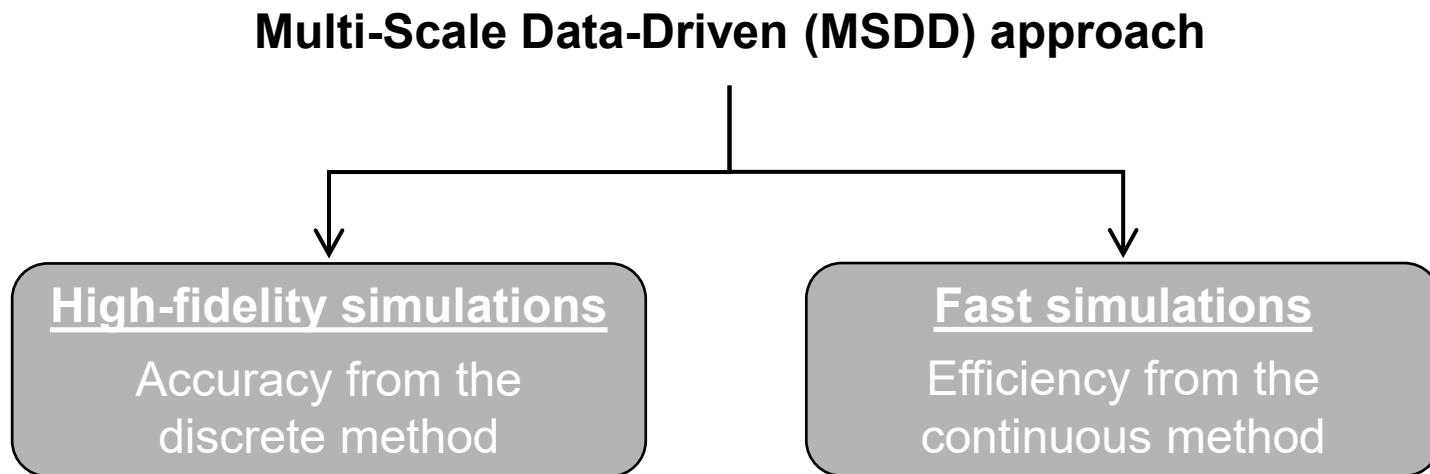

# Modeling Limitations

## Continuum-discrete hierarchical multiscale

- Alleviates the limitations of continuous and discrete methods.
- Online (runtime) RVE simulations: Too expensive for real-world problems.
- Seldom applied to investigate thermomechanical effects.

# Objectives

## Ingredients

Continuum-discrete  
hierarchical multiscale

Pre-computed  
microscale solutions

Machine-learning  
surrogate model

Purpose: Thermomechanical analyses

**1 – Introduction**

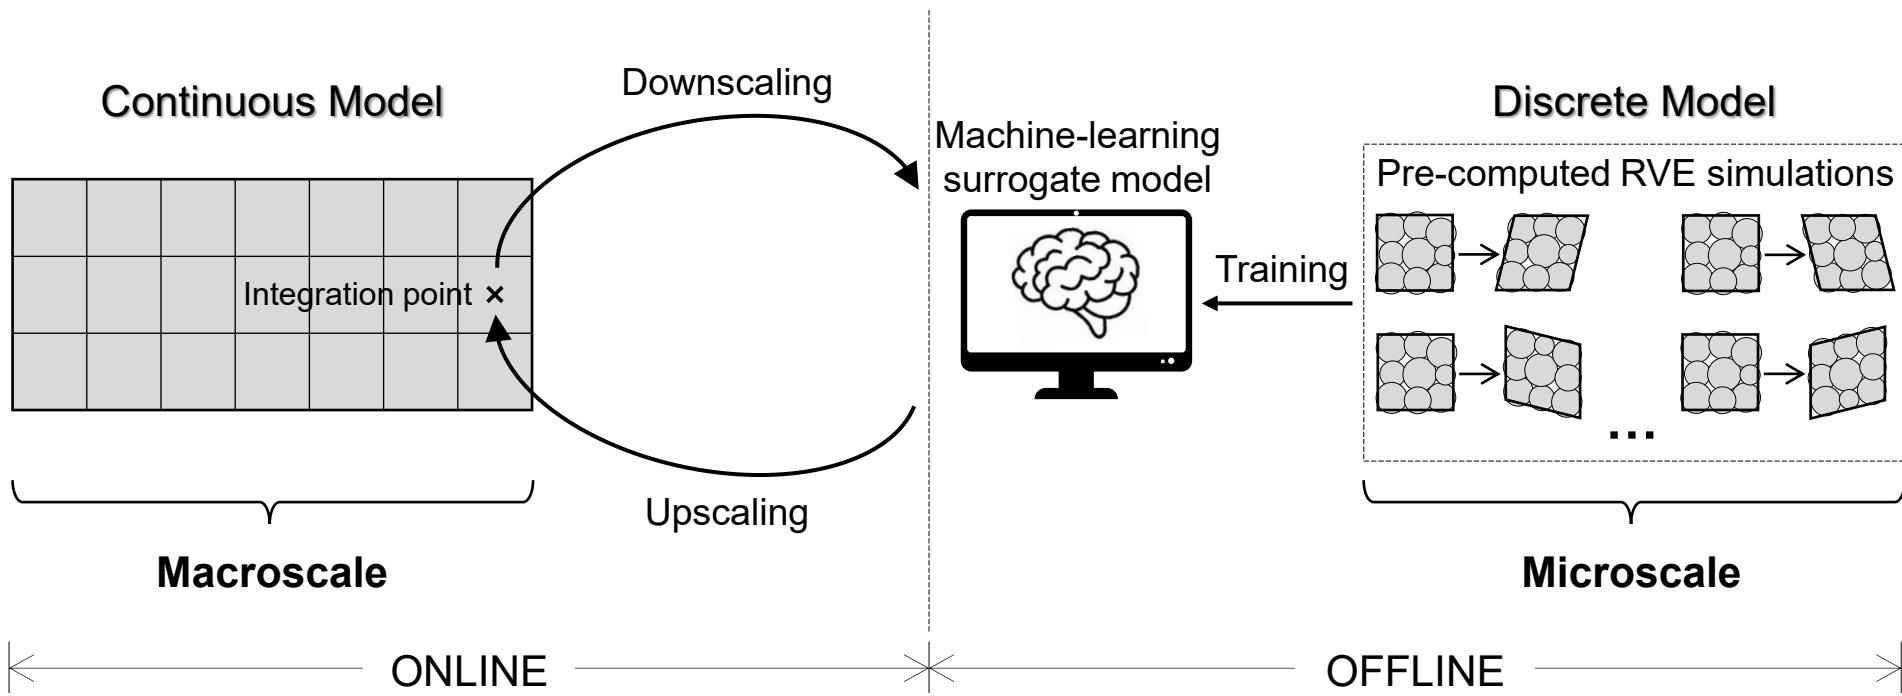

**2 – Methodology**

**3 – Results and Discussions**

**4 – Conclusions**

# General Scheme

## Multi-Scale Data-Driven (MSDD) approach

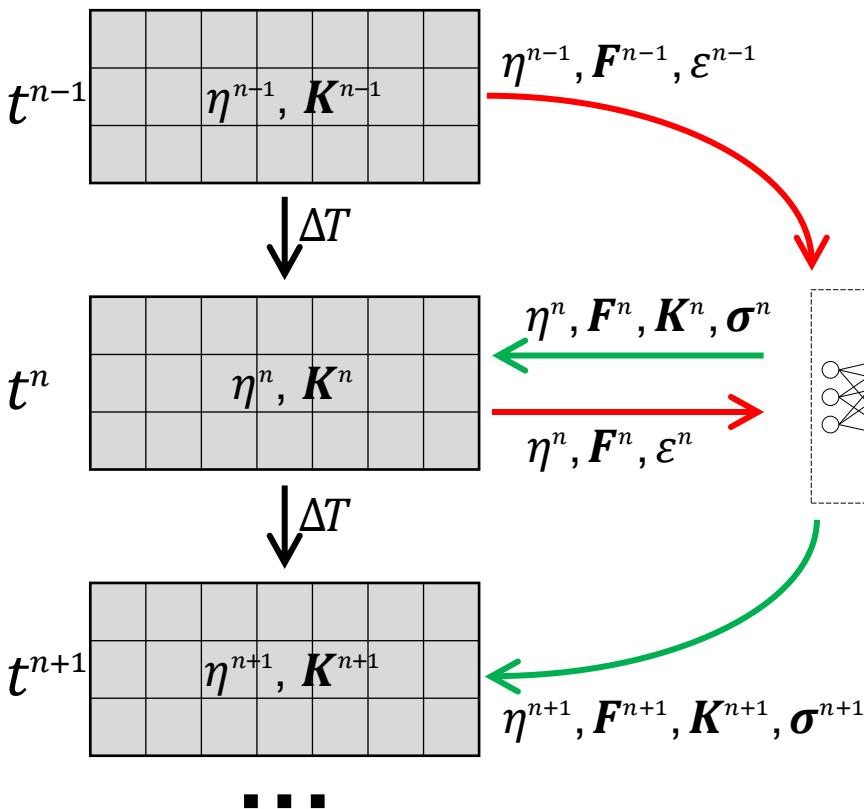

- Current scope: {
- Thermal effects: heat conduction + thermal expansion
  - Small deformations in confined systems
  - Two-dimensional (2D) models with no gravity

# Specific Scheme

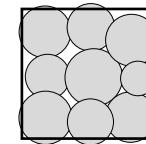

## Continuous model

$$\rho_s(1 - \eta) \frac{\partial T}{\partial t} = \nabla \cdot (\mathbf{K} \nabla T)$$

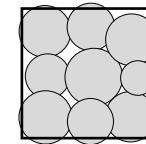

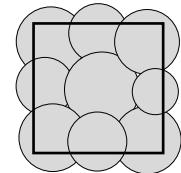

## DEM RVEs

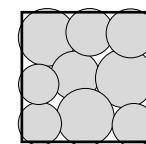

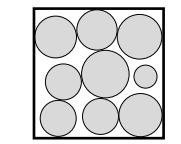

Input config.  
 $(\eta, \mathbf{F})_0$

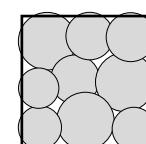

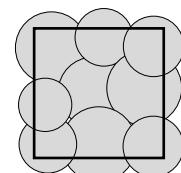

$$\varepsilon > 0$$

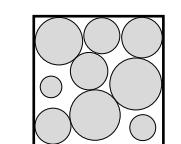

$$\varepsilon < 0$$

$$\varepsilon > 0$$

$$\varepsilon < 0$$

$T$ : Temperature

$\rho_s$ : Solid density

$\eta$ : Porosity

$\mathbf{F}$ : Fabric

$\varepsilon$ : Thermal strain

$\mathbf{K}$ : Conductivity

$\sigma$ : Stress

# Macroscale Continuum Solver

## Transient heat diffusion problem

$$\varrho c \frac{\partial T}{\partial t} = \nabla \cdot (\mathbf{K} \nabla T) \quad \text{in } [\Omega, t] \quad \text{where: } \varrho = \rho_s(1 - \eta)$$

$$T = \bar{T} \quad \text{in } [\Gamma_D, t]$$

$$\mathbf{K} \nabla T \cdot \mathbf{n}_\Gamma = \bar{q} \quad \text{in } [\Gamma_N, t]$$

$$T = T_0 \quad \text{in } [\Omega, 0]$$

Open∇FOAM

## Finite Volume Method (FVM)

$$\sum_i \left( (\varrho c)_i \left( \frac{\partial T}{\partial t} \right)_i \Omega_i - \sum_{b \in \Gamma_i} (\mathbf{K} \cdot \nabla T \cdot \mathbf{n})_b \Gamma_b \right) = 0 \quad \left\{ \begin{array}{l} \text{Time integration scheme: Implicit 1^{st}-order} \\ \text{Spatial approximation: 2^{nd}-order operators} \end{array} \right.$$

Effective granular properties ( $\mathbf{K}$ ,  $\varrho c$ ) depend on the current microstructure

# Microscale Discrete (DEM) Solver

Equations of motion

$$\begin{cases} \frac{d\boldsymbol{v}}{dt} = \frac{\boldsymbol{f}}{m}, & \boldsymbol{f} = \boldsymbol{f}_d + \sum^{N_n} \boldsymbol{f}_n + \boldsymbol{f}_t \\ \frac{d\boldsymbol{\omega}}{dt} = \boldsymbol{I}^{-1} \boldsymbol{M}, & \boldsymbol{M} = \sum^{N_n} \boldsymbol{M}_{f_t} \end{cases}$$

Thermal energy

$$\begin{cases} \frac{dT}{dt} = \frac{q}{mc}, & q = \sum^{N_n} q_c \end{cases}$$

# Microscale Discrete (DEM) Solver

Equations of motion

$$\begin{cases} \frac{d\boldsymbol{v}}{dt} = \frac{\boldsymbol{f}}{m}, & \boldsymbol{f} = \boldsymbol{f}_d + \sum^{N_n} \boldsymbol{f}_n + \boldsymbol{f}_t \\ \frac{d\boldsymbol{\omega}}{dt} = \boldsymbol{I}^{-1} \boldsymbol{M}, & \boldsymbol{M} = \sum^{N_n} \boldsymbol{M}_{f_t} \end{cases}$$

Thermal energy

$$\begin{cases} \frac{dT}{dt} = \frac{q}{mc}, & q = \sum^{N_n} q_c \end{cases}$$

**Mechanical interaction models** (Linear forces + Coulomb friction + damping)

$$\boldsymbol{f}_n = -s_n \delta_n \boldsymbol{n} \quad \text{where: } s_n = 2er_1r_2/(r_1 + r_2)$$

$$\boldsymbol{f}_t = \begin{cases} \boldsymbol{f}_t^{\text{prev}} - vs_n \Delta \boldsymbol{u}_t & \text{if } \|\boldsymbol{f}_t\| \leq \|\boldsymbol{f}_n\| \tan(\varphi) \\ \|\boldsymbol{f}_n\| \tan(\varphi) \boldsymbol{t} & \text{otherwise} \end{cases}$$

$$\boldsymbol{f}_d = -\mu \|\boldsymbol{f}_c\| \frac{\boldsymbol{v}}{\|\boldsymbol{v}\|}$$

# Microscale Discrete (DEM) Solver

Equations of motion

$$\begin{cases} \frac{d\boldsymbol{v}}{dt} = \frac{\mathbf{f}}{m}, & \mathbf{f} = \mathbf{f}_d + \sum^{N_n} \mathbf{f}_n + \mathbf{f}_t \\ \frac{d\boldsymbol{\omega}}{dt} = \mathbf{I}^{-1} \mathbf{M}, & \mathbf{M} = \sum^{N_n} \mathbf{M}_{ft} \end{cases}$$

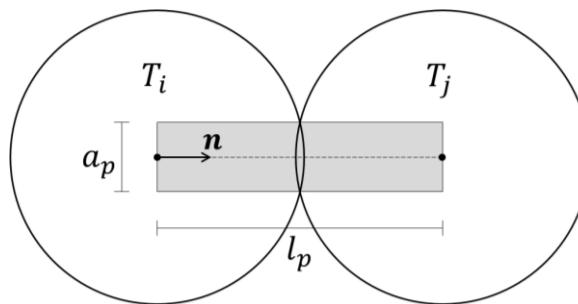

Thermal energy

$$\begin{cases} \frac{dT}{dt} = \frac{q}{mc}, & q = \sum^{N_n} q_c \end{cases}$$

## Thermal interaction model (Thermal pipe model)

$$q_c = -k a_p \frac{(T_i - T_j)}{l_p}$$

## Thermal expansion model (Linear model)

$$\Delta r = \varepsilon r^0 \quad \text{where, thermal strain: } \varepsilon = \alpha \Delta T$$

# Micro-to-Macro Upscaling Formulation

## Fabric tensor

$$\mathbf{F} = \frac{1}{N_c} \sum_{N_c} \mathbf{n} \otimes \mathbf{n}$$

2D:  $\mathbf{F} = \begin{bmatrix} F_{xx} & F_{xy} \\ F_{xy} & F_{yy} \end{bmatrix}$

Since  $\text{tr}(\mathbf{F}) = 1$  and  $F_{xy} \approx 0$ ,  $\mathbf{F}$  is represented as a scalar fabric index:  $f = F_{xx} - F_{yy}$

## Effective thermal conductivity tensor

$$\mathbf{K} = \frac{1}{V} \sum_{N_c} k a_p l_p \mathbf{n} \otimes \mathbf{n}$$

$\left\{ \begin{array}{l} \bullet \text{ Derived for thermal pipe model} \\ \bullet \text{ Geometry-based (no heat applied)} \\ \bullet k: \text{Particles conductivity} \end{array} \right.$

## Cauchy stress tensor

$$\boldsymbol{\sigma} = \frac{1}{V} \sum_{N_c} (-l_p \mathbf{n}) \otimes (\mathbf{f}_n + \mathbf{f}_t)$$

Mean effective stress:  $p = \frac{1}{\dim} \text{tr}(\boldsymbol{\sigma})$

# RVE Packing Generation

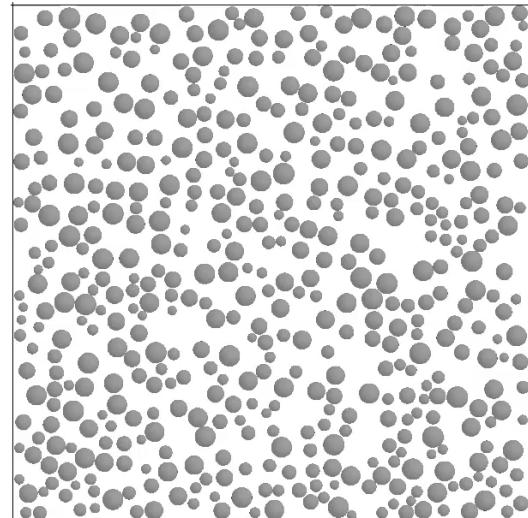

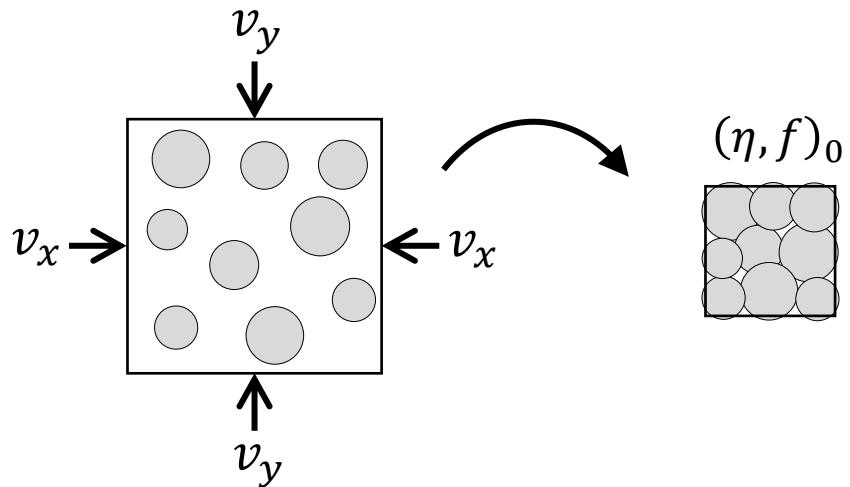

Particles randomly positioned  
in a control volume

Compression by flat walls

No gravity

Compression stop criterion:  
target packed porosity ( $\eta_0$ )

Relative wall velocities in X,Y directions  
to modify packed fabric ( $F_0$ )

# RVE Packing Generation

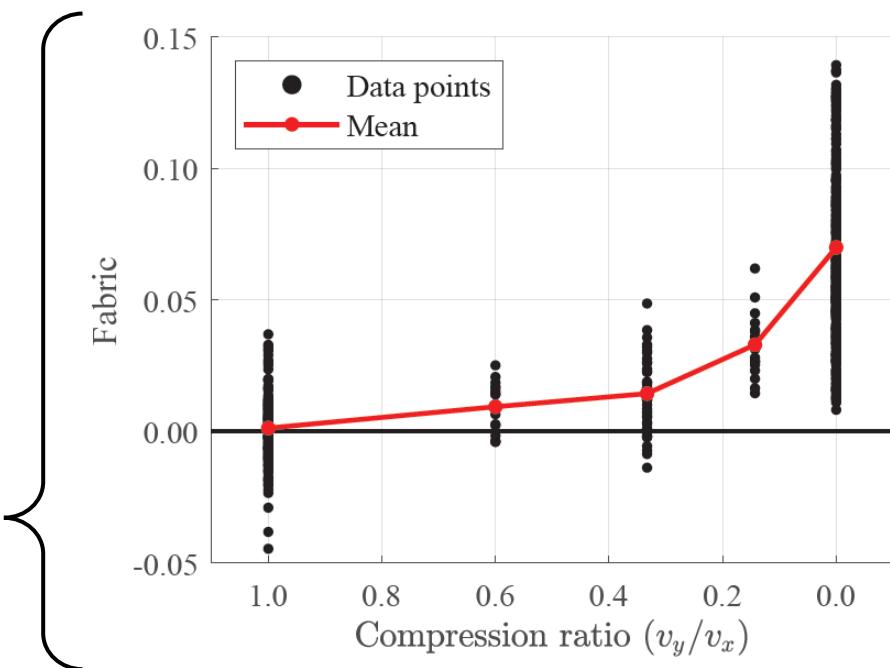

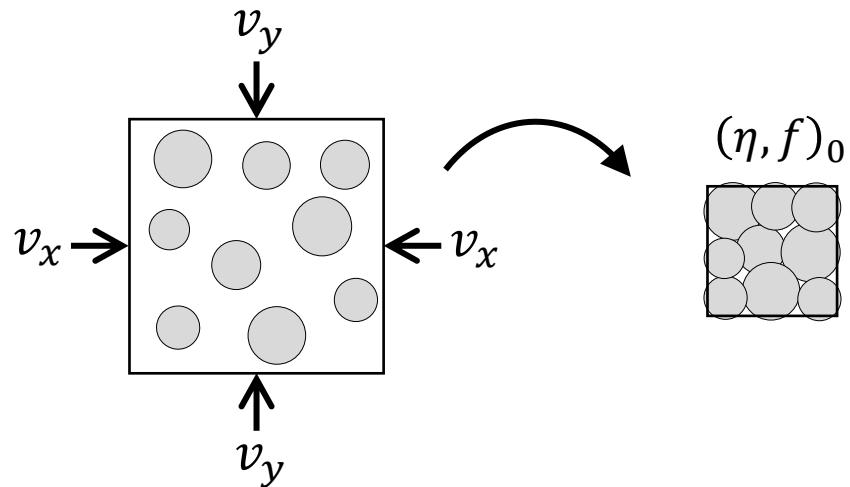

Particles randomly positioned  
in a control volume

Compression by flat walls

No gravity

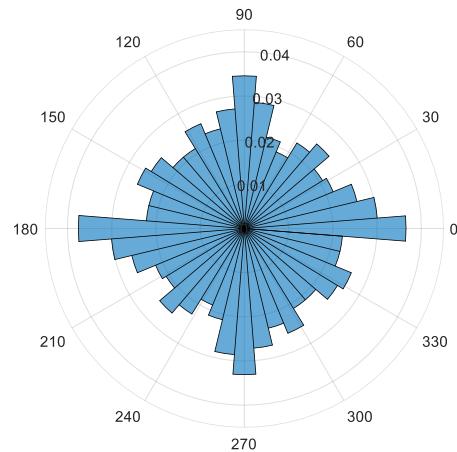

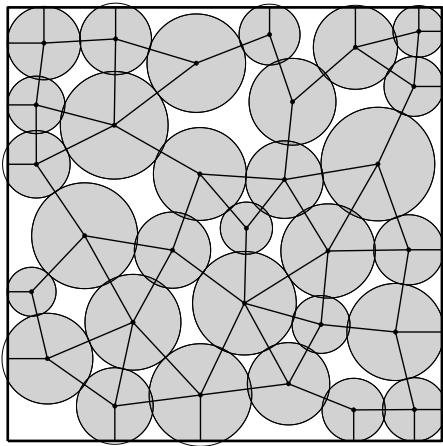

Compression stop criterion:  
target packed porosity ( $\eta_0$ )

Relative wall velocities in X,Y directions  
to modify packed fabric ( $F_0$ )

# RVE Boundary Treatment

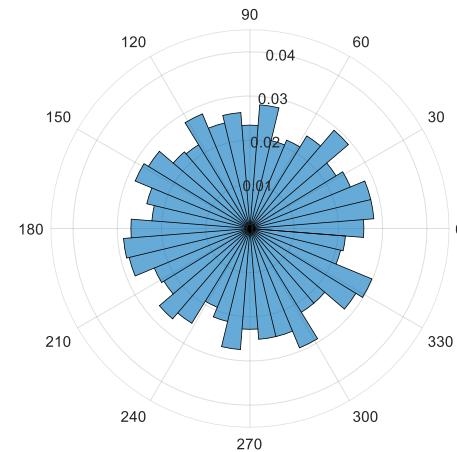

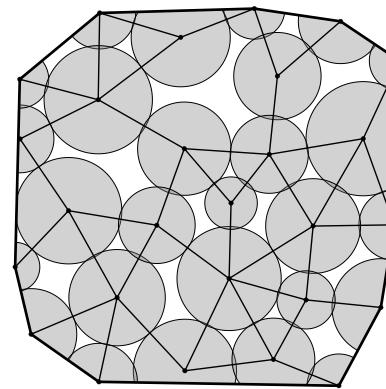

## All contacts

Predominance of main XY directions

## Internal contacts

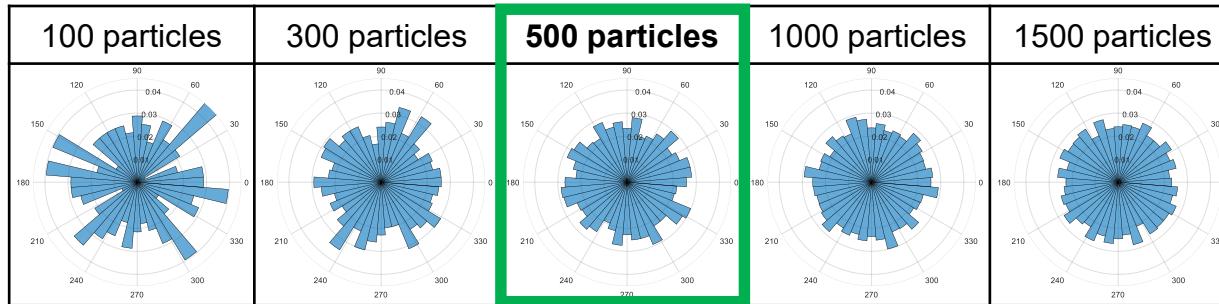

Convex hull

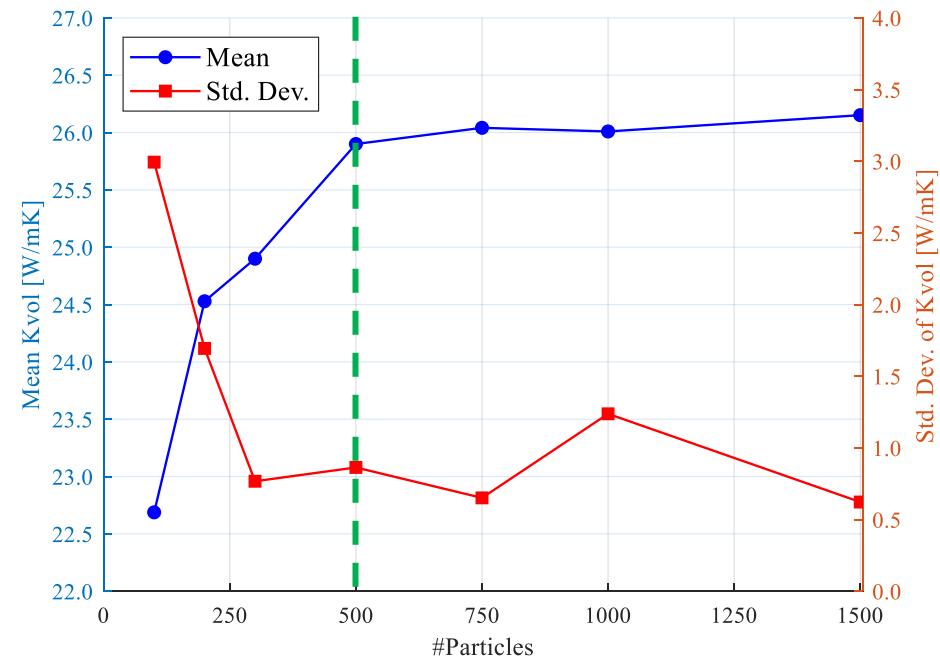

Wall effects are vanished

# RVE Representativeness

## Convergence of rose diagram

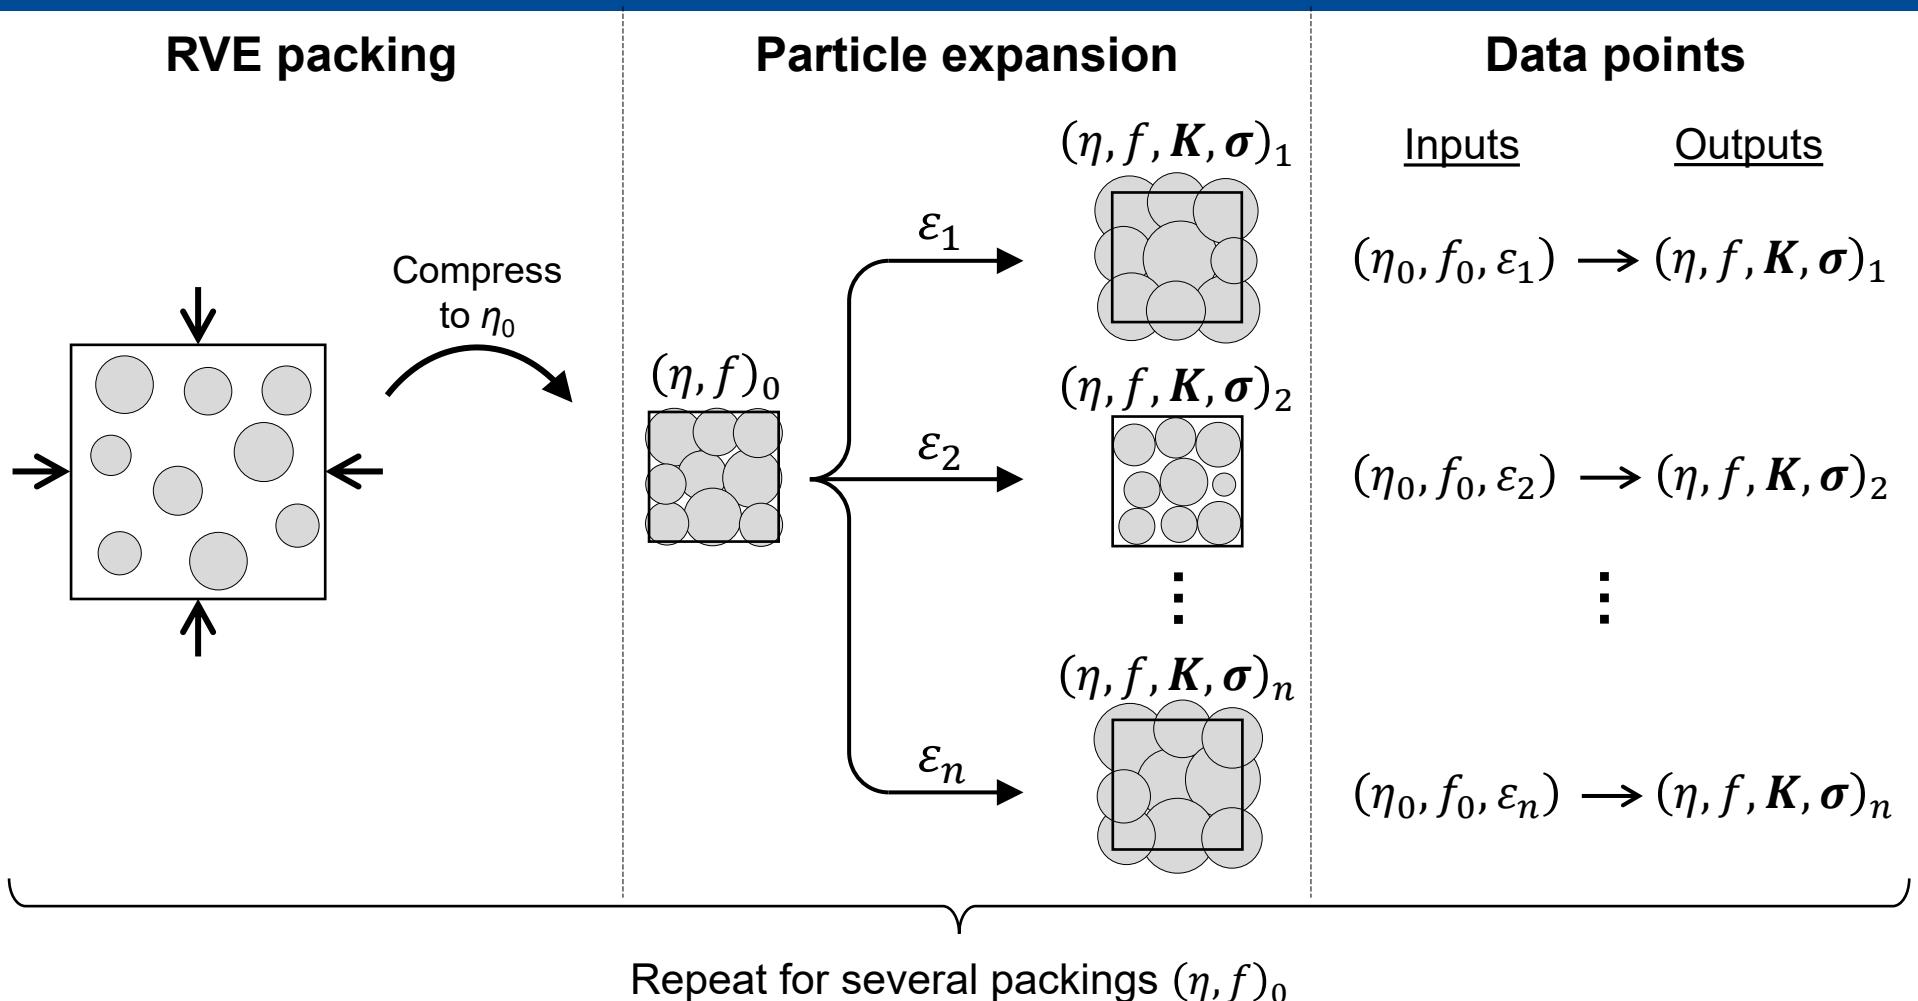

## Convergence of effective conductivity

10 RVEs packings with different #particles

500 particles: Good balance between Computational Cost vs. Representativeness

# Microscale Database Generation

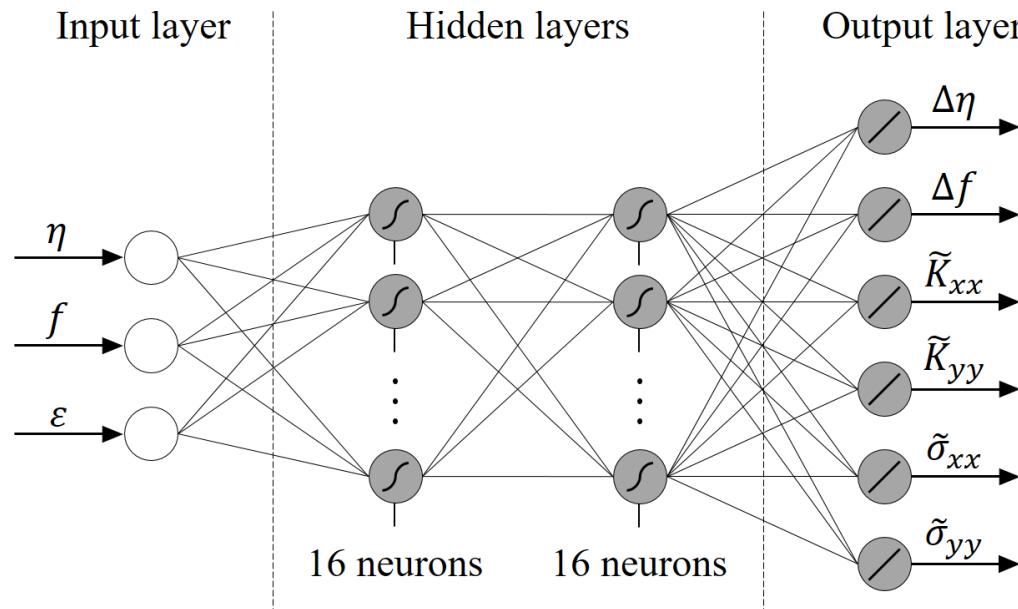

Frame invariance:  $\left\{ \begin{array}{l} \text{Simulated data points: } (\eta_0, f_0, \varepsilon) \rightarrow (\eta, f, K, \sigma) \\ \text{Rotated data points: } (\eta_0, -f_0, \varepsilon) \rightarrow (\eta, -f, K^R, \sigma^R) \quad R: 90^\circ \text{ rotation} \end{array} \right.$

# Microscale Surrogate Model

$$(\Delta\eta, \Delta f, \tilde{K}, \tilde{\sigma}) = \psi(\eta, f, \varepsilon) \quad \left\{ \begin{array}{l} \text{Dimensionless outputs} \\ \tilde{K} = \frac{K}{K} \quad K: \text{Particle conductivity} \\ \tilde{\sigma} = \frac{\sigma}{E} \quad E: \text{Particle Young's modulus} \\ \\ \text{Diagonal components} \\ \tilde{K} = \tilde{K}_{xx}, \tilde{K}_{yy} \\ \tilde{\sigma} = \tilde{\sigma}_{xx}, \tilde{\sigma}_{yy} \end{array} \right.$$

## Artificial Neural Network

**1 – Introduction**

**3 – Results and Discussions**

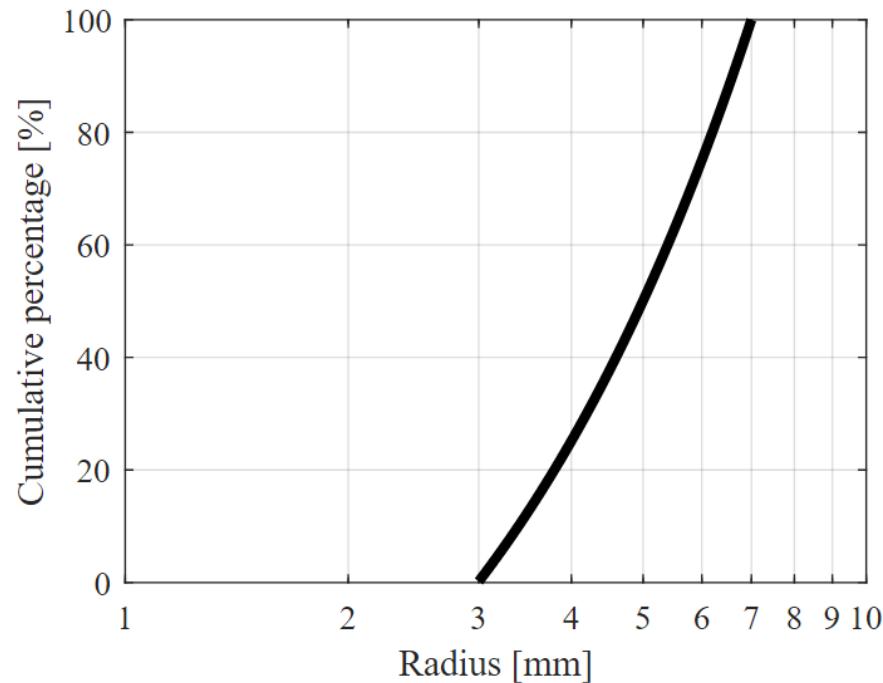

**4 – Conclusions**

# Granular Material Adopted

## Particle properties

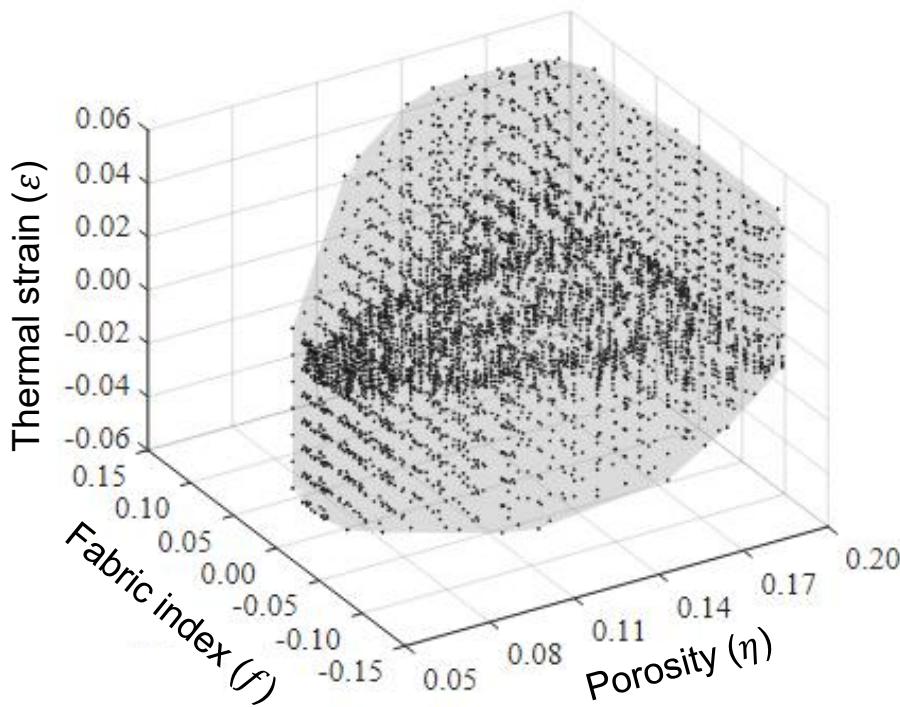

Property	Value
Density [kg/m <sup>3</sup> ]	3000
Young's modulus [MPa]	10
Stiffness ratio [-]	0.8
Friction angle [-]	0.5
Thermal conductivity [W/m·K]	100
Specific heat capacity [J/kg·K]	1.0
Thermal expansion coeff. [-]	0.001
Damping coeff. [-]	0.1

## Particle size distribution

# Microscale Database

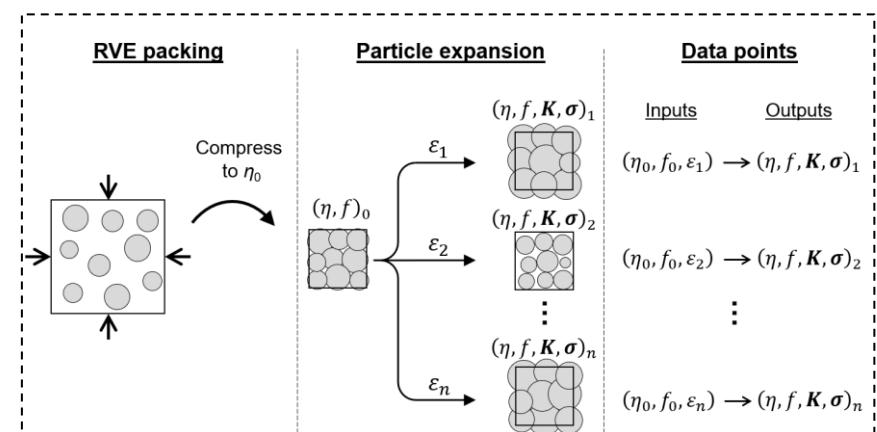

Database input space ( $\eta, f, \varepsilon$ )

5172 data points:

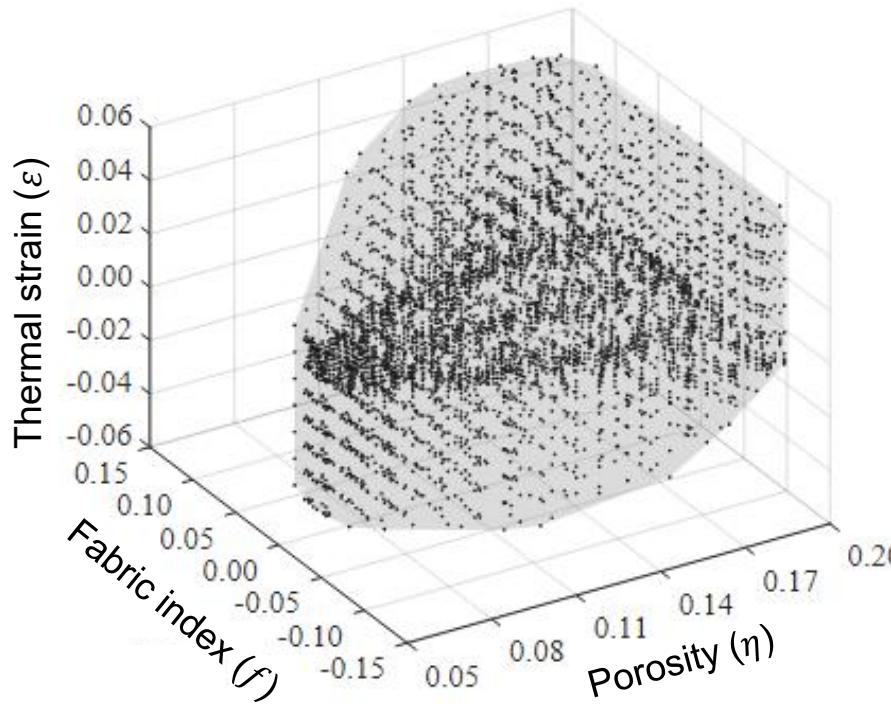

- Porosity: 6.0% – 19.5%
- Fabric: -0.14 – 0.14
- Strain: -5.0% – 5.0%

Reliable ANN prediction region  
(Convex hull of data points)

# Microscale Database

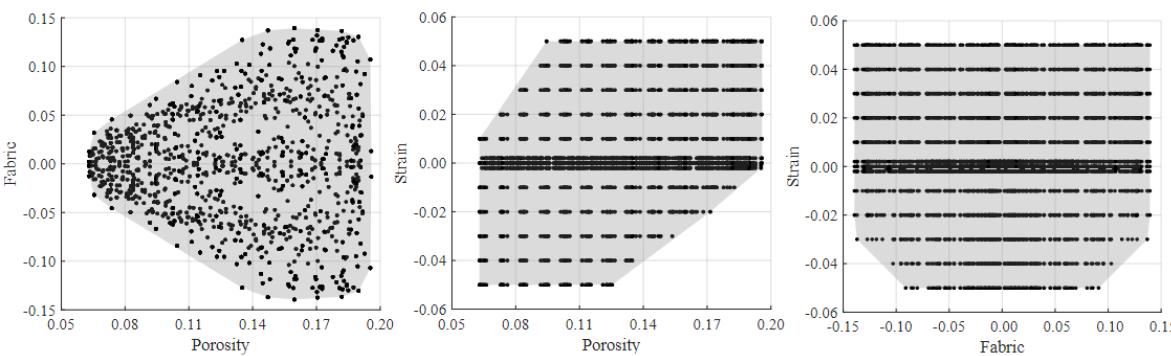

Database input space ( $\eta$ ,  $f$ ,  $\varepsilon$ )

5172 data points:

- Porosity: 6.0% – 19.5%
- Fabric: -0.14 – 0.14
- Strain: -5.0% – 5.0%

Reliable ANN prediction region  
(Convex hull of data points)

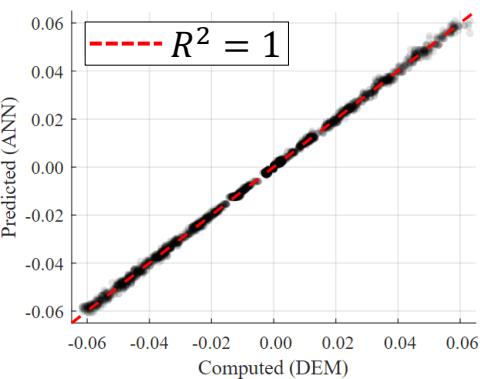

Higher concentration  
for small  $\varepsilon$

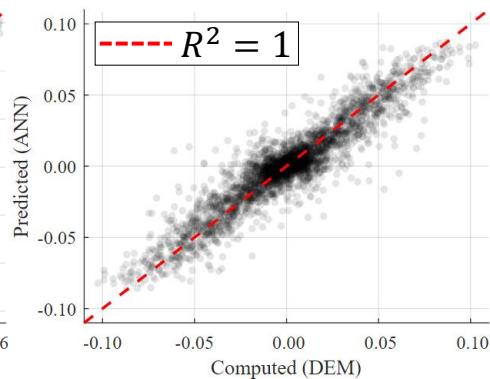

# ANN Training

## Output predictions

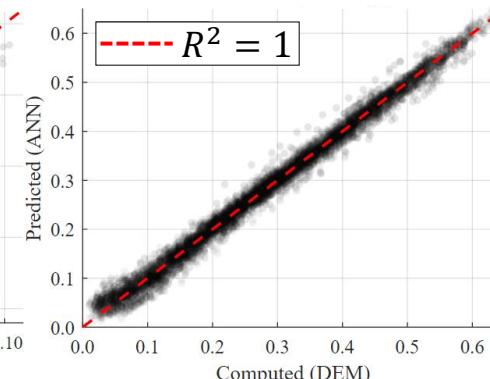

$\Delta\eta$ :  $R^2 = 0.999$

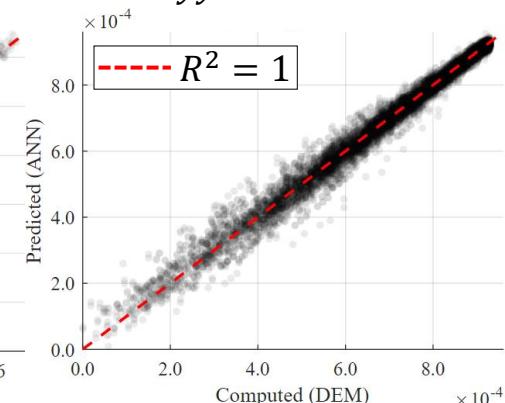

$\Delta f$ :  $R^2 = 0.859$

$\tilde{K}_{xx}, \tilde{K}_{yy}$ :  $R^2 = 0.989$

$\tilde{\sigma}_{xx}, \tilde{\sigma}_{yy}$ :  $R^2 = 0.980$

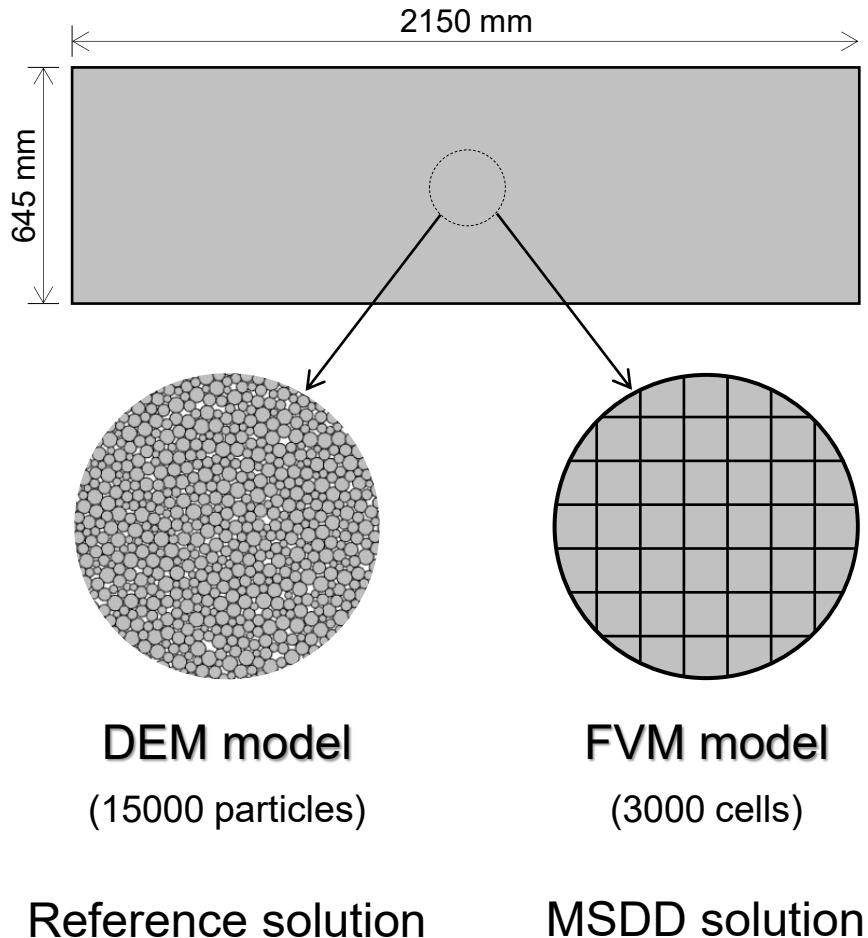

## Output sensitivity to inputs

Excluded input	$\Delta\eta$	$\Delta f$	$\tilde{K}_{xx}, \tilde{K}_{yy}$	$\tilde{\sigma}_{xx}, \tilde{\sigma}_{yy}$
-	0.999	0.859	0.989	0.980
$f$	0.998	0.003	0.935	0.851
$\eta$	0.985	0.834	0.358	0.362
$\varepsilon$	0.132	0.256	0.649	0.664

No surplus or missing of important parameters!

# Validation Example

## Comparison between DEM and MSDD solutions

# Analysis Cases

$T = 100 \text{ K}$

$T^0 = 50 \text{ K}$

**Case  
Hot**

- 1. No thermal expansion ( $H^*$ )
- 2. Thermal expansion ( $H$ )

$T = 0 \text{ K}$

$T^0 = 50 \text{ K}$

**Case  
Cold**

- 3. No thermal expansion ( $C^*$ )
- 4. Thermal expansion ( $C$ )

Insulated

$T^0 = 50 \text{ K}$

$T = 0 \text{ K}$

Insulated

**Case  
Hot-Cold**

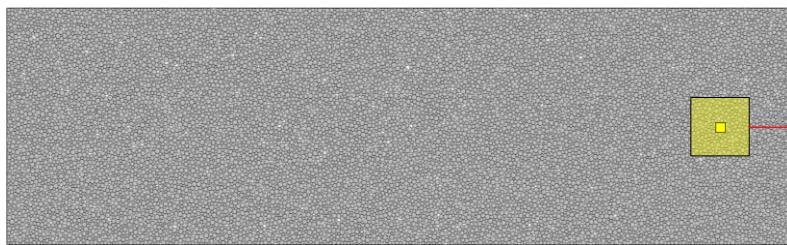

- 5. No thermal expansion ( $HC^*$ )
- 6. Thermal expansion ( $HC$ )

# Initial Conditions for MSDD Solution

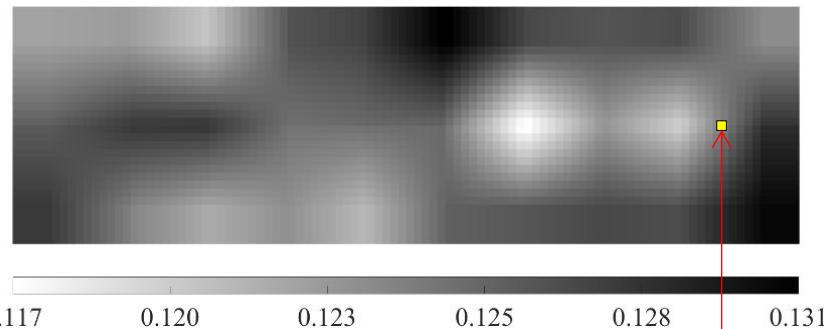

## FVM model for MSDD

### Reference DEM model

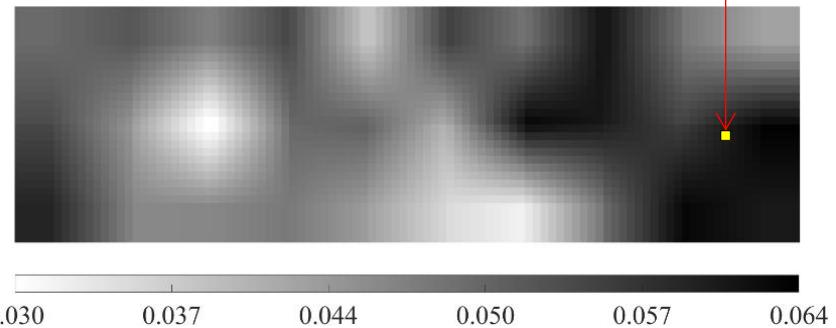

Properties calculated locally around each FVM cell centroid

Local porosities ( $\eta$ )

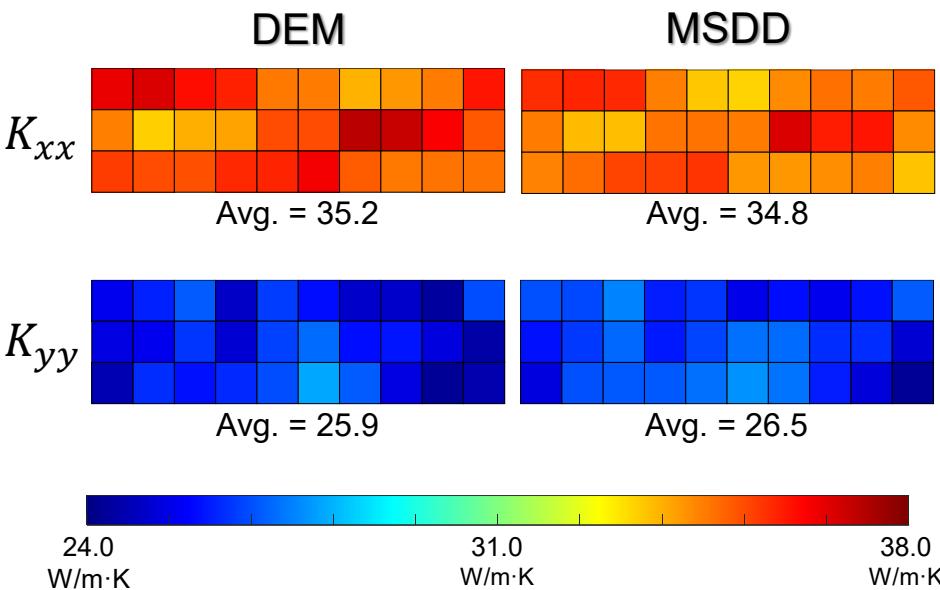

Local fabric indexes ( $f$ )

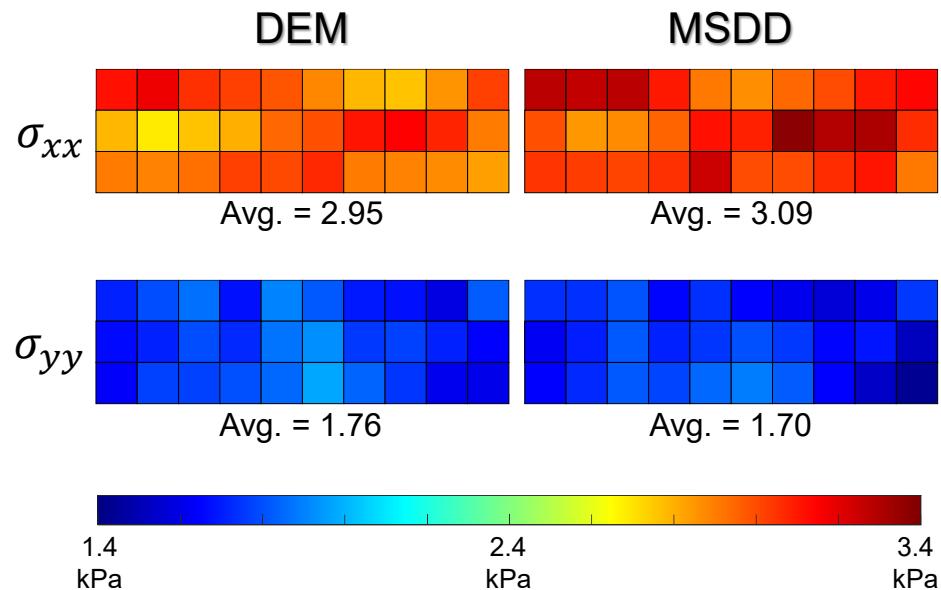

# Results Without Thermal Expansion

## Thermal conductivity distribution

## Cauchy stress distribution

Purely thermal analysis: static microstructure.

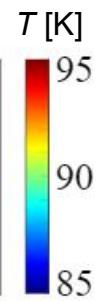

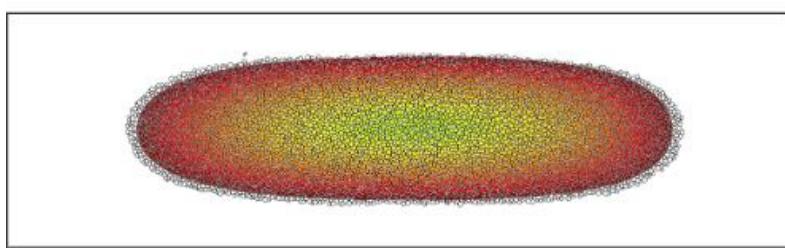

Good predictions of  $K$  and  $\sigma$  from porosity and fabric.

# Results Without Thermal Expansion

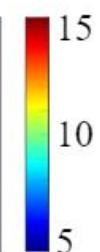

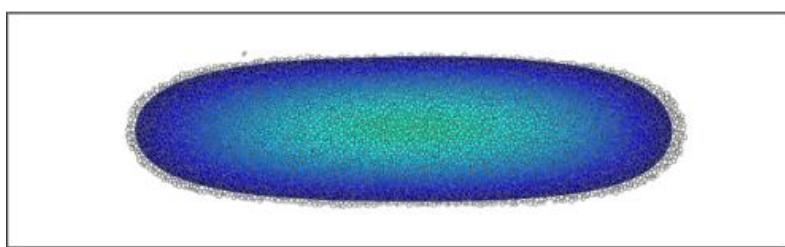

**Temperature contours**

(at 8 seconds)

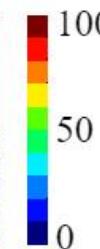

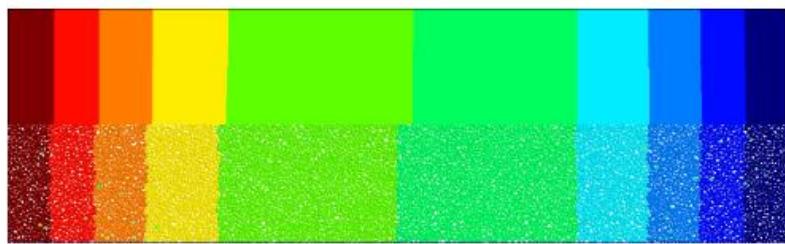

Case H\*

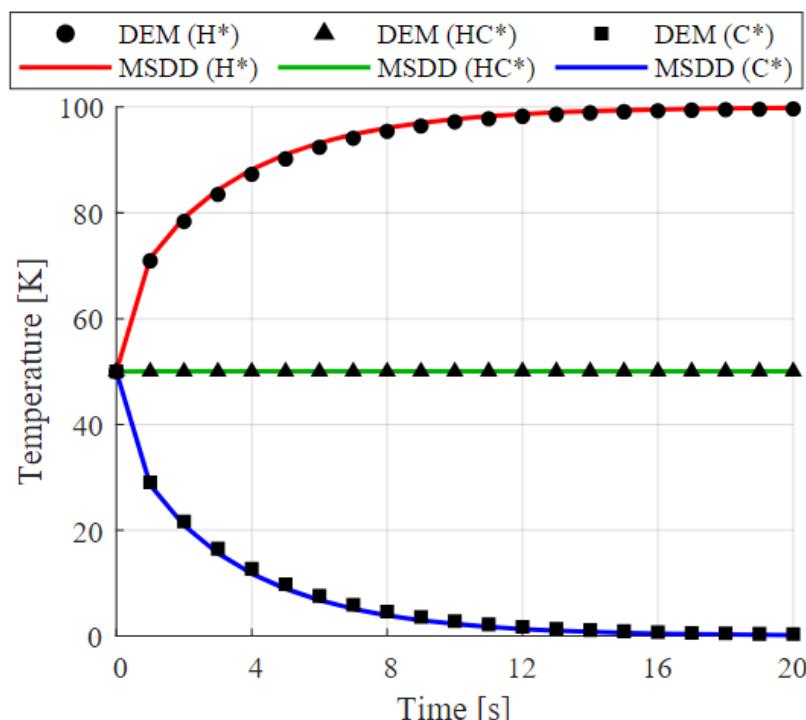

Case C\*

Case HC\*

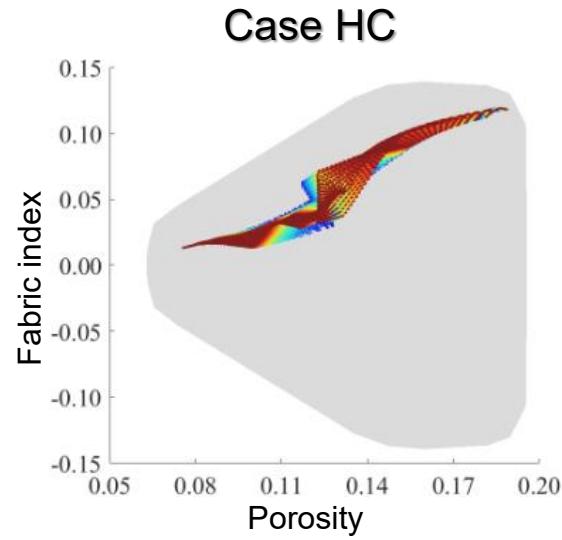

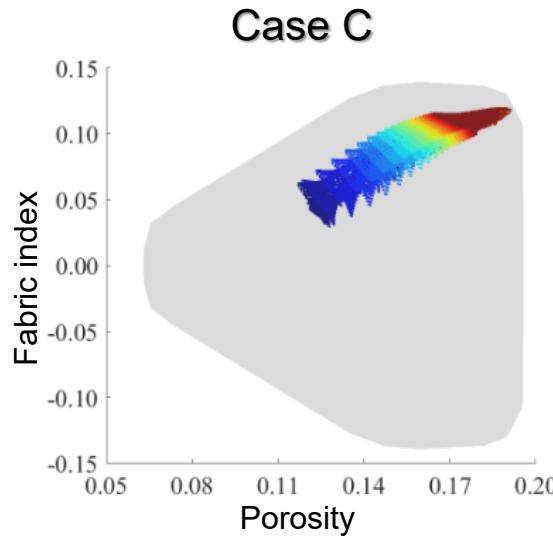

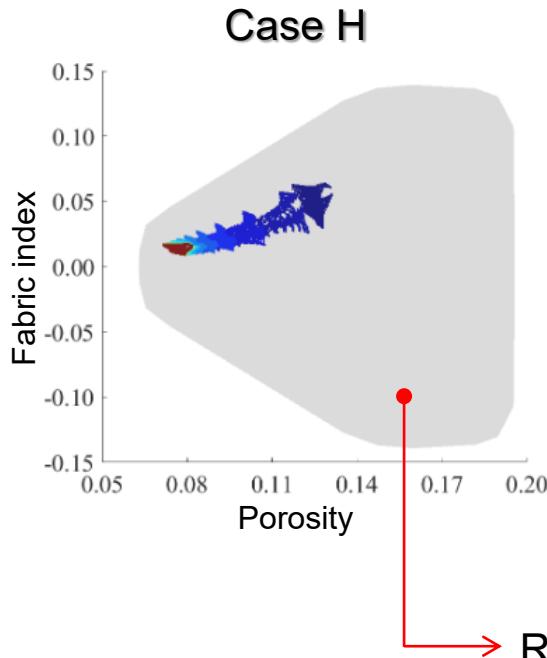

**Average temperature evolution**

# Results With Thermal Expansion

## Transient response

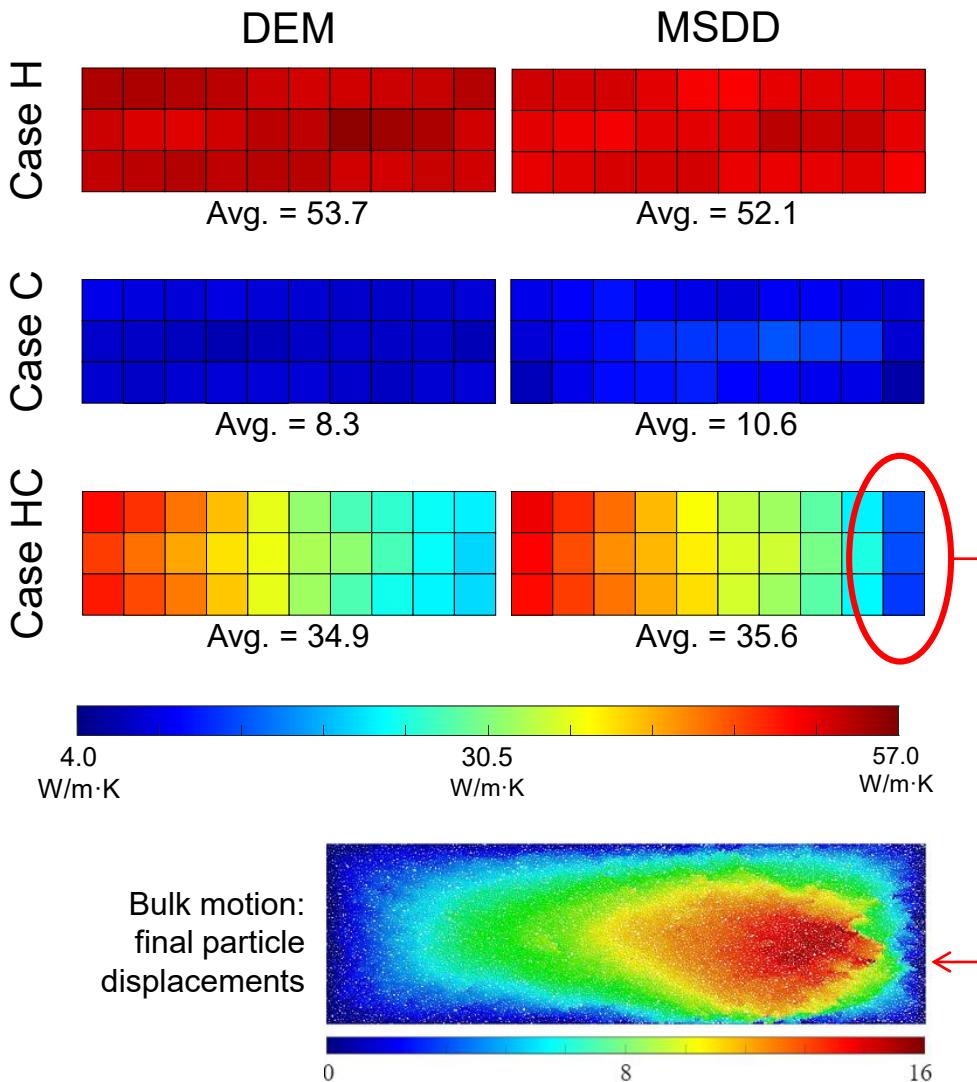

Evolution of input parameters ( $\eta, f$ ) in the MSDD solution

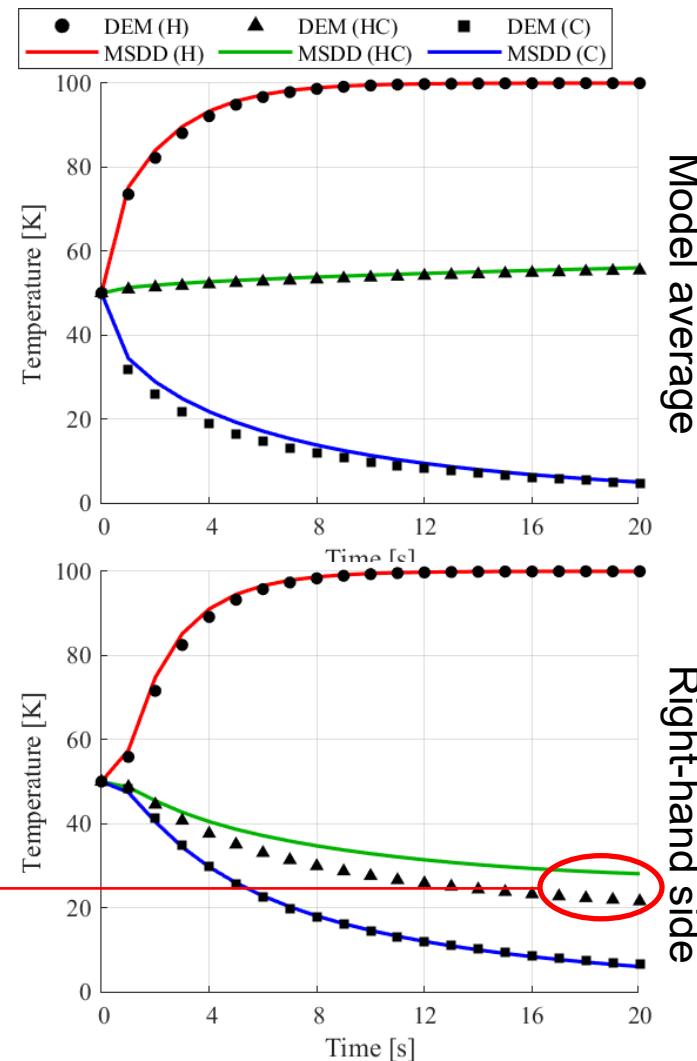

No extrapolation by the surrogate model!

# Results With Thermal Expansion

Final thermal conductivity distribution  $K_{xx}$

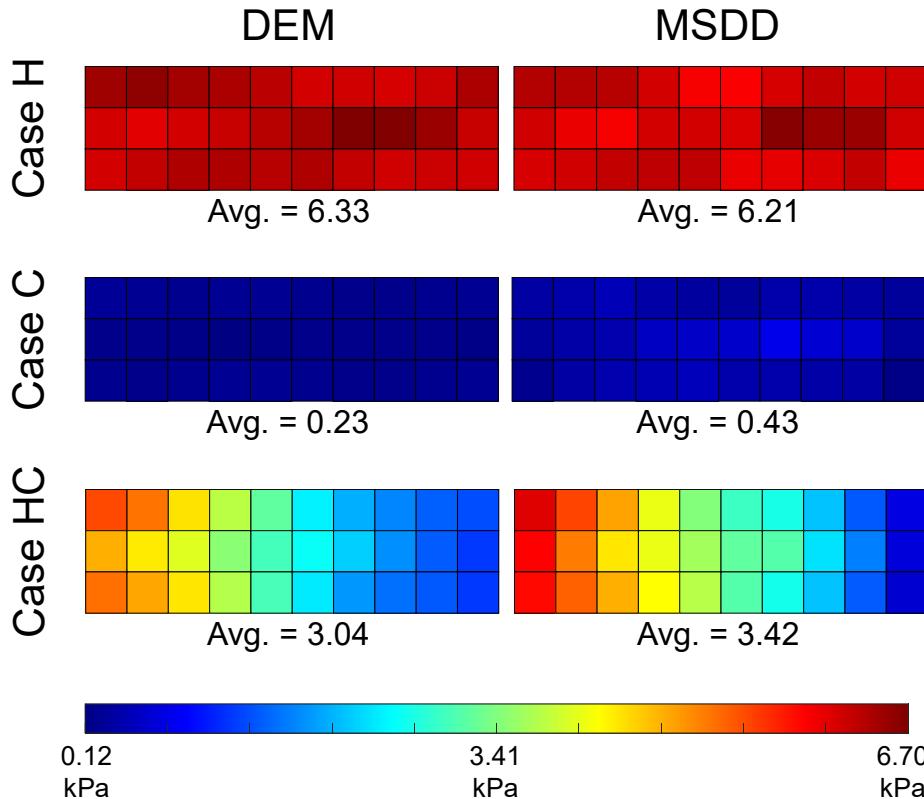

Temperature evolution

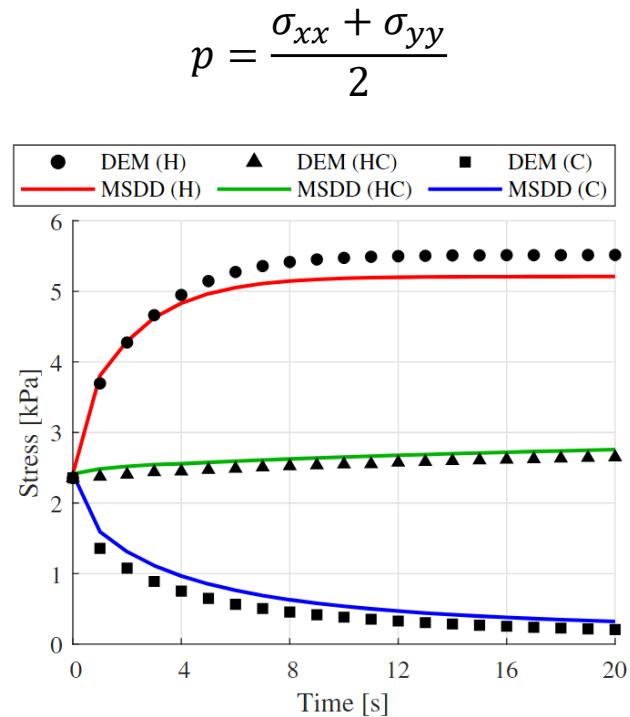

# Results With Thermal Expansion

Final Cauchy stress distribution  $\sigma_{xx}$

Average effective stress evolution

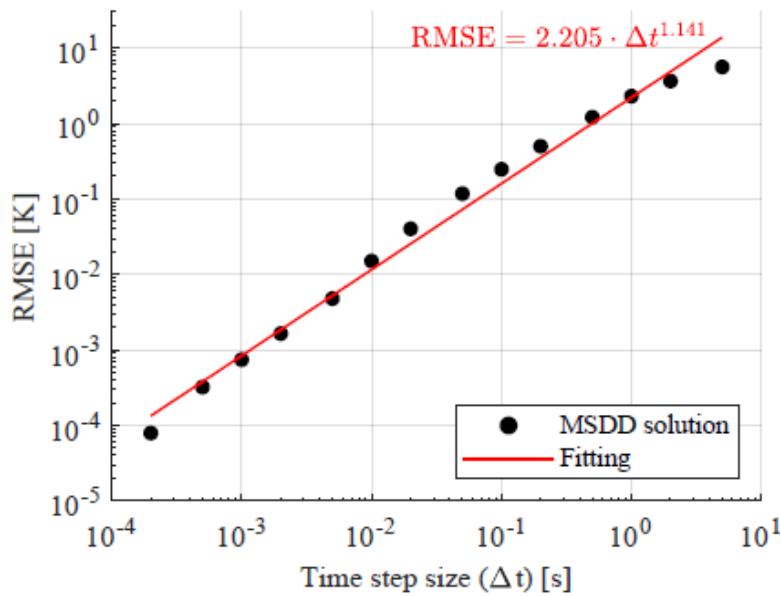

# Results With Thermal Expansion

## Convergence analyses of MSDD solution

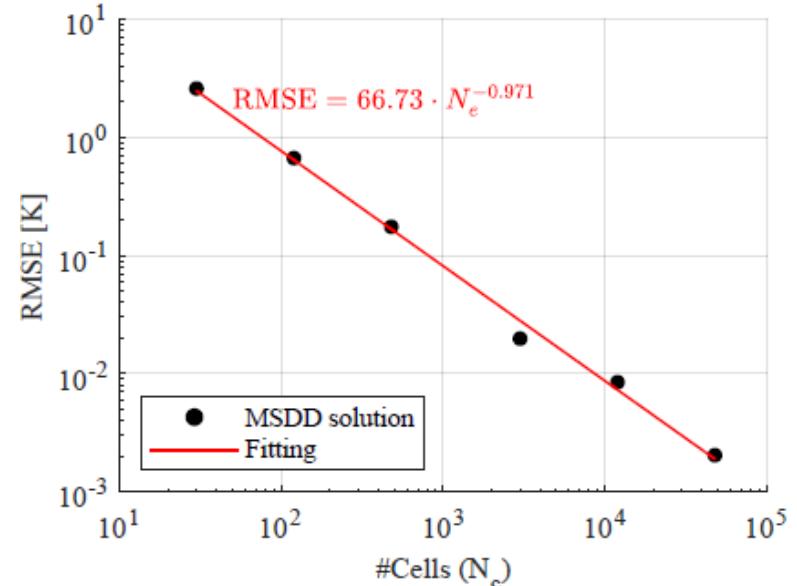

### Time step size

(RMSE for avg. temperature in case H)

### FVM mesh refinement

(RMSE for avg. temperature in case H)

# Results With Thermal Expansion

## Simulation Elapsed Times

Analysis case	DEM wall-clock time [s]	MSDD wall-clock time [s] *	DEM / MSDD speedup factor
H	112,054		$2.7 \times 10^3$
C	78,551	41	$1.9 \times 10^3$
HC	96,591		$2.4 \times 10^3$

\* Online macroscale solution only

**1 – Introduction**

**2 – Methodology**

**3 – Results and Discussions**

**4 – Conclusions**

# Conclusions

## Main achievements

- An online-offline approach based on machine-learning for hierarchical multiscale modeling.
- Transient analyses of thermal expansion and conduction in confined granular media.
- Validation results show:
  - Accuracy comparable to DEM.
  - Efficiency of a continuous method.

## Main limitations

- **Database generation cost:**  
Several RVE simulations for each particular problem.
- **Microscale representativeness:**  
Variability of microscale response in RVEs with similar configurations.
- **ANN fitting errors:**  
Influence of neglected input parameters.
- **Bulk granular motion:**  
Mass / size conserving RVEs cannot account for global particle displacements.

# Future Work

- Extend to 3D.
- Surrogate model generalization:  
Different particle size distributions, etc.
- Extend thermal behavior:  
Different heat transfer mechanisms and models.
- Add mechanical behavior:  
Solve equilibrium equation at the macroscale: larger deformation problems
- Apply to real-world problems:  
Thermal cycling, granular flows, etc.
